

Understanding How Roofs Generate Above Curved Walls

Reference Number: **KB-03019**

Last Modified: **November 18, 2024**

QUESTION

How can I control how roof planes generate above curved walls?

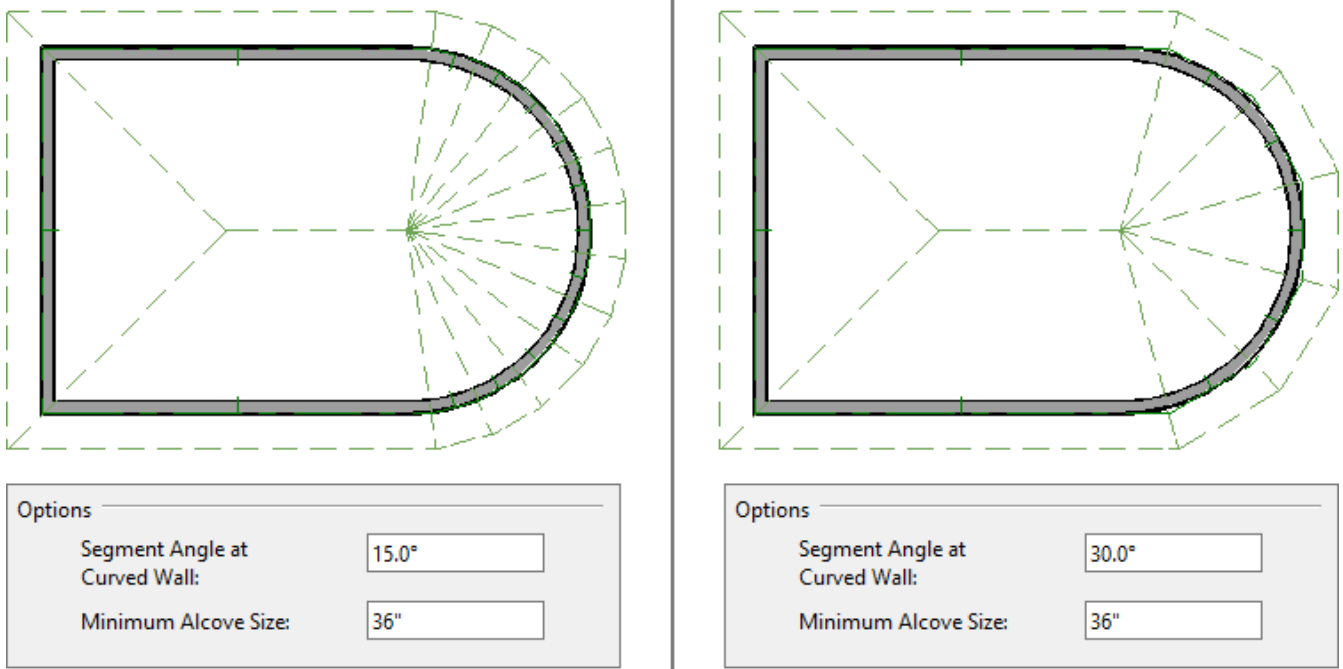

ANSWER

Automatically generated roof planes are created above curved walls at specified increments.

On the **ROOF** panel of the **Build Roof** dialog, you can specify the **Segment Angle at**

Curved Wall to your desired value, as long as it's between 6° and 60°. A smaller angle produces more roof planes. In some instances, slightly smaller or larger values will be used instead of the specified value.

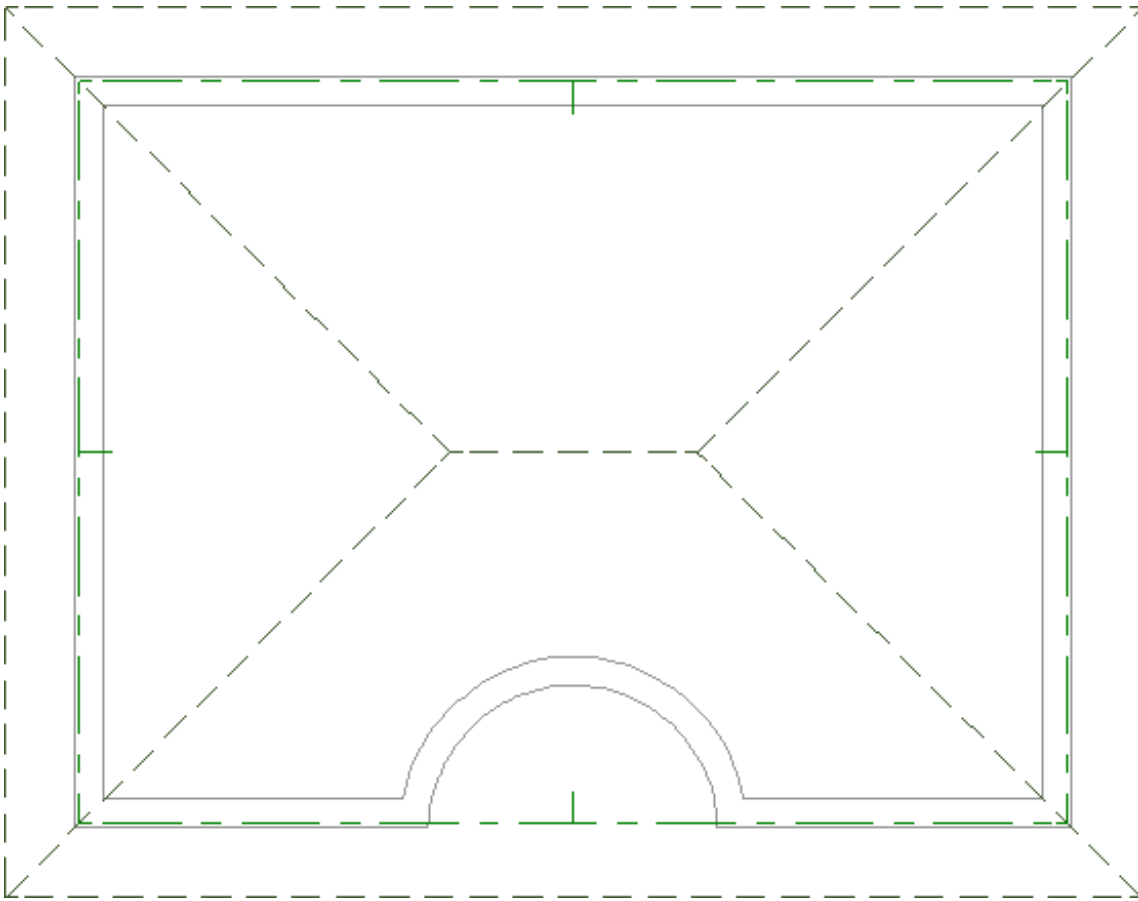

The following illustration shows a roof created at two different curved increments: 15° and 30°.

Regular roof plane sections can also generate above concave curved walls. For roof sections to generate above a concave curved wall, the sections' baselines must be longer than the **Minimum Alcove Size** value on the **ROOF** panel of the **Build Roof** dialog.

If the baselines are shorter, the automatically generated roofs are simplified by either:

- Ignoring the curved wall, as if the walls on either side extended to their meeting point.

- Spanning the concave curved wall with a straight baseline, resulting in a separate roof plane.
